Individual reflection on the project design

Username: zongchengd

Student No: 1096319

Name: zongcheng DU

In the design phase of the entire model of our group, I participated in the brainstorming part and put forward suggestions on topic selection. Later, I was responsible for the model building part together with another classmate Zhizhang. I wrote the Outcome section of the document. I finally drew the model flow chart and GANTT diagram.

I think in this group cooperation, I did a good job. I can communicate effectively with team members in every meeting. Exchange our views and jointly complete different chapters of the report. When the data collection part encountered difficulties, other team members and I took the initiative to help him find effective data collection. According to the time plan, I effectively completed the work that I was responsible for before each time node.

Due to the short project design time, it is the first time for us to do this kind of work. I have some confusion when selecting methods and analyzing them. I don't know what method is better for our data. I have a discussion with my teammates who are also responsible for this part. We checked a lot of information and ArcGis documents. Finally chose the workflow used in our report. Besides, Compared with previous group cooperation in other subjects, I think this group cooperation is particularly successful. We allocate tasks reasonably, and everyone is responsible for what they do best. Chloe is a great team leader, she can manage time and progress. I am very happy to work with her.

As the person in charge of the method and graph part of the group, I did my job well. I hope that in the future cooperation, our group members can communicate more actively in the Facebook group. As we all know, the model is inseparable from data, and I should also communicate with the students in charge of the progress of the data, so as to make our project more perfect.
